

1. Review of Agricultural IoT Technology

Why it matches your project

This paper provides the technological foundation for implementing IoT-based smart farming systems and sensor networks.

Summary

The paper presents a comprehensive review of Agricultural IoT technologies and their applications. It explains the three-layer architecture of Agricultural IoT, consisting of perception, network, and application layers. Various technologies such as sensors, wireless communication, cloud computing, and intelligent control systems are discussed. The paper explores applications in crop cultivation, greenhouse management, livestock monitoring, and precision agriculture. It also addresses challenges related to security, interoperability, and implementation costs. The study concludes that IoT technology is fundamental to the development of smart and automated farming systems.
