

2. High-Technology Agriculture System to Enhance Food Security

Why it matches your project

This paper focuses on **smart irrigation systems** using IoT technologies, making it highly relevant to the irrigation functionality of your robot.

Summary

The paper proposes a high-technology agricultural framework that integrates sensors, IoT gateways, cloud computing, and data analytics to support intelligent farming. The system enables real-time monitoring, automated irrigation, and remote control of agricultural operations. Experimental findings indicate that the proposed system improves crop productivity, enhances water-use efficiency, and reduces labor requirements. The authors conclude that smart agricultural systems can significantly contribute to food security and sustainable farming.
